

ALBOHOLIC

Project plan: a web platform for Albanian history, heroes, places and stories

1. Vision

A modern, readable home for Albanian history. Everything is created in STUDIO with AI assistance and human review, and readers explore it in EXPLORE. Content is English first, with Albanian as a second language. No monetization for now: the goal is to go online first, then look for opportunities.

2. The two sides

EXPLORE (public)

- Home page with featured stories and "on this day in Albanian history"
- Article pages: stories, heroes, places, events
- Timeline of Albanian history, filterable by era
- Hero, place and event pages linked to related articles
- Search and browsing by era, region and topic
- English and Albanian versions of each piece

STUDIO (private, only me)

- Source library: YouTube links, web URLs, PDFs and books
- AI drafting and editing workspace
- Fact review, translation and publishing controls
- Content management for articles, people, places and timeline events

3. The STUDIO pipeline

- 1 **Add source.** Paste a link or upload a file. The system pulls the transcript or text and saves it with its metadata.
- 2 **Extract facts first.** The AI lists claims (who, what, when, where), each tied to a timestamp or page. No writing yet.
- 3 **Draft from facts only.** The article uses only the extracted facts, so every statement traces back to a source.
- 4 **Human review.** Draft shown next to the source, with flagged dates, names and numbers. Nothing publishes without approval.
- 5 **Translate.** The AI generates the Albanian version, which is reviewed.
- 6 **Publish.** Set cover image, tags, era and links to people, places and events. Schedule or publish.

The facts-first step protects against AI hallucinations, which are a real risk with history.

4. Suggested tech stack

- **Next.js** with Tailwind CSS (server-rendered, good for SEO)
- **Postgres via Supabase** for the database, file storage and login

- **Claude API** for fact extraction, drafting and translation
- **Auth:** only my email can enter STUDIO; all STUDIO routes protected server-side
- **Transcripts:** YouTube captions, with speech-to-text as fallback
- **Hosting:** Vercel, with STUDIO at /studio or a subdomain

5. Core data model

- **Article:** type (story, hero, place, event), status (draft, review, published), English and Albanian content
- **Person, Place, Event:** each with its own page; events carry dates for the timeline
- **Source:** type, URL or file, extracted text
- **Claim:** the fact, its source location, and whether it is verified
- **Tags and eras:** Illyrians, Skanderbeg, Ottoman period, Independence, Communist era, modern Albania

6. Build phases

- 1 **Foundation:** project setup, database, auth, STUDIO shell
- 2 **MVP:** YouTube-to-article pipeline plus basic EXPLORE (article pages, home page). Publish the first 10 to 15 articles to test the whole loop.
- 3 **More sources:** web URLs and PDFs, then the timeline and people, place and event pages
- 4 **Bilingual:** Albanian versions, language switcher, translation review flow
- 5 **Polish and launch:** search, SEO, analytics, newsletter signup, places map

7. Decisions to make early

- **Copyright:** always rewrite in my own words, cite every source, never copy transcript or book text. Books are research material, not something to reproduce.
- **Source reliability:** show a Sources section on every article to build trust.
- **Scope discipline:** keep the timeline, map and full bilingual support out of the MVP.
